Introduction:

Title of the project: smart store.

Research Question:How to integrate Django with AI models to achieve better sales and smarter solutions for our online store by suggesting similar products?

Objective of the project:

The project aims to enable users to select products and view similar products at the bottom of the page.

Expected outcome:

The user will can choose any product then

He will see similar products that he interstate in .

Methodology:

In the index page the the user will see cards of products ·every card has unique id If he press Add to card the form will send the id to [model.py](#) file ,then he will predict similar products ·send them to the index.html ,they will appear Under the card of products.

Flow chart:

While true:

show page():

Show card:

Form.send(card[index]

similar array=Model.predelect(card[index])

for i in similar:

Show i
